

Most Definite Causes to Seek the Help of Infertility Doctor

Infertility is not less than a curse for the society and especially for the couple, amongst whom, one of the partner exhibits incapability to participate in the process of child birth. In most of the cases, it is inability of the woman to become pregnant and there are a number of causes behind it. If you are experiencing the similar situations in life, you need not worry, as there are many medical treatments available to help you fight against this capability. However, before that you must explore the root cause behind the problem.

Some Most Obvious Reasons

In case of woman's inability to conceive a child or carry a pregnancy, there could exist one of the following reasons as culprit: Androgens, the hormone present in a woman's body in less amount as compared to that of man's, may result in this incapability if secreted in high amount. This results in Polycystic Ovary Syndrome, which disturbs the menstrual cycle. Ovarian failure due to weakness of follicles may also result in this situation. It is often termed as early menopause and is experienced by woman above the age of 35 years. The frequent miscarriages are caused by failure of ovum in accomplishing endometrial implantation. Also known as Luteal Phase defect, it also contributes towards pregnancy incapability in women. The growth of cyst in the ovary may also participate in raising the incapability to conceive a child. This cyst is grown in the form of a fluid bag in the ovary. Blockage in the release of eggs may also cause the failure to conceive and is commonly referred to as endometriosis. Other Reasons for This Condition

Apart from those mentioned above, there are other reasons, which may result in this situation. It is a good idea to get familiarized with them as well. Infection in any part of the reproduction system, which may be caused by bacteria, also results in this undesirable condition. Treatment procedures for other problems like cancer may also interfere in the process of conceiving and lead to loss in the fertile characteristics of a woman. Restriction in the growth of eggs, due to blockage of fallopian tube by abnormal growths like tumor, may also reduce the probability of carrying a baby by woman. Reasons are many, but there are equivalent numbers of treatments available to get rid of all these factors and enhance your fertility. For this, you need to consult one of the fertility specialists in your area.
